APE

The Art of Sound, Infinite Monkey Theorem

for flute, bass clarinet percussion, piano, violin, cello, double bass, and electronics

Duration 11’ 30 minutes

Denton, Texas

Performance Notes

General

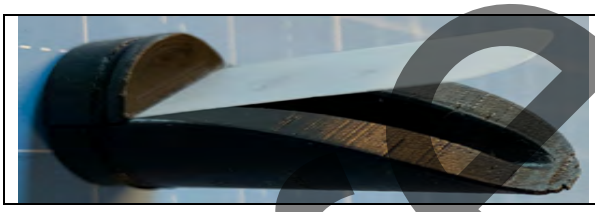
- The virtuosity required for the piece may be called ‘La Virtuosité du Son’. The musician has the task to make sounds and not to play sounds.
- The score works rather as a manual, which instructs the performer, how to produce and manipulate the sounds required for the piece.
- The notation doesn’t imply necessarily the sound produced. The written note does not always correspond to the one that is sounded. The performer should follow the written note regardless of the sounding result.
- The change from one sound type to another should not be executed at one instance (unless indicated) but a ‘transition time’ should allow the sound to be shaped. This transition time is important and creative tool for the interpretation of the piece.
- Emphasis should be given on the precise production of the variable sound possibilities and the right distinction of one to another in order to be able to convey the musical ideas and structure of the piece.
- The compositional method as an ‘Écriture du Son’ which is based on sound-to-sound structures, on transformation strategies from one to another as well as on functional classification sound models.
- The significance of the diatonic interval, harmony and melody ceases to exist. The music is the sound.

***

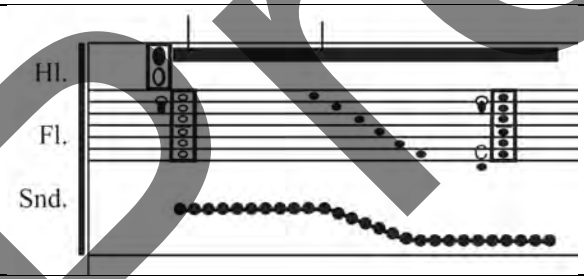
Besides the in-score descriptions of the performance notes a complete catalogue of detailed audio/video examples is provided upon request by the composer. This is in order to give to the performer a better insight on how to produce each particular sound, which is so crucial for the piece.
For detailed performance notes, please refer to the online video demonstrations. Below you will find an index of the audio/video performance notes by measure numbers:
Moreover, a reference studio mix of the piece can be provided upon request.

***

FLUTE - Sound Lexicon



ULTRA THIN SYNTHETIC REED CAPSULE
You will need to use a special ultrathin synthetic reed capsule. For more info please email the composer.



STAFF
The **Flute** staff has six spaces (instead of four) because represent the flute fingering. Black noteheads indicate closed keyholes and white noteheads open keyholes. The thick black stripe longitudinal to the top two lines **Hole** displays the blowing position with the completely covered (top to normal flute playing with the hole open.

SOUND STAFF: The lower section of the staff provides a visualization of the sound to be produced. The vertical axis represents frequency and the horizontal axis time. Generally, the coloring/density represents loudness, black for the loud to white for quite sounds. The patterns displayed in this section provide an arbitrary visualization of the sound to be produced such as high/low, bright/dull, ordered/chaotic, coherent/erratic, smooth/coarse, soft/raspy, tonal/noisy, etc. In addition, a number of onomatopoetic and/or echomimetic words and expressions aiming to represent or imitate a sound or its context.

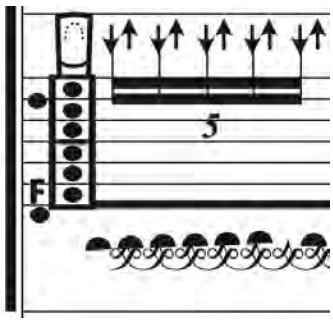
Sound Lexicon

Video and audio performance notes and instructions can be found on the dedicated webpage.

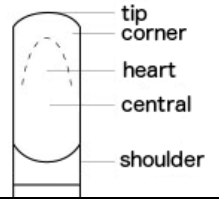
***

Bass Clarinet

ULTRA THIN SYNTHETIC REED
You will need to use a special ultrathin synthetic reed. For more info, please email the composer.



STAFF
- The **top** section is the reed space, which displays the position of the lower lip (from tip to shoulder) and the pressure against the reed. The closer to the tip the higher the sound the closer to the shoulder the lower the sound. The thicker the line the looser the lip, the thinner the line the more pressure is applied to the reed. The more the pressure the higher the pitch and less roughness to the sound. The less the pressure the lower the pitch and more roughness to the sound.
- The seven lines **middle** section indicates the clarinet's fingering.
- The **lower** section of the staff provides a visualization of the sound to be produced. The vertical axis represents frequency and the horizontal axis time. Generally, the coloring represents loudness in terms of the frequency from black for the loud frequencies to white for silence. The patterns displayed in this section provide an arbitrary visualization of the sound to be produced such as high/low, bright/dull, ordered/chaotic, coherent/erratic, smooth/coarse, soft/raspy, tonal/noisy, etc. In addition, a number of onomatopoetic and/or echomimetic words/letters aiming to represent or imitate a sound or its context such as aggressive, peaceful, mournful cry of pain, mental and physical suffering, sorrow or pleasure.



REED ANATOMY
The vamp of the reed is notated in five distinct areas: tip, corner, heart, central and shoulder. Each area is capable of producing a wide range of sounds described below.

Bellow sound	Heart, harmonics	Corner Lip	Tip Clack sound	Tip Slap	Central, harmonics	Shoulder Groan Sound
						

SHOULDER: GRUNT SOUND
Square note-head. The lower lip should touch the ligature. Blow from the diaphragm and let the reed to swing inside the mouth cavity. A low pulsated rough sound should be produced. It also be combined with slap-tongue at the onset of the sound.

HEART: CLACK SOUND
Square note-head. The distance between the lower lip and the heart of the reed should be wide enough to create the clack like sound as you blow. Blow a narrow air stream, the stronger you blow the louder the clack sound. Also, the lower the fingering/note you play the slower the clack sound. Therefore, by changing fingerings you can control the speed/ pitch of the sound.

CENTRAL: GROAN SOUND
Square note-head. The sound is grainy with reminisces of a guttural sound made by an animal.
It could also be combined with singing (right).

	*TIP: CLACK SOUND* The space between the lower lip and the tip of the reed should be wide enough to create the clack/slap like sound. Form the lips to create a narrow air stream, the stronger you blow the louder the clack sound, the space between lower lip and reed also affects the quality of the clack sound. Also, the lower the fingering/note the slower the clack sound. Therefore, by changing fingerings you can control the speed/ pitch of the sound.
	*CORNER: CLAP SOUND* Moon note-head. Touch lightly the lower lip at the tip/corners of the read. By lightly touching the reed, as it is vibrating you smooth out the percussive quality and the pulse sound warmer and less bright/ clunky with no transients. Although the air stream might be continuous the resulting sound might have interruptions. The distance between the lower lip and the reed as well as the air pressure affect the sound. The closer the lower lip to the reed the buzzier the sound. The further the distance between lower lip and the reed the more clap like the sound.

Sound Lexicon

Video and audio performance notes and instructions can be found on the dedicated webpage.

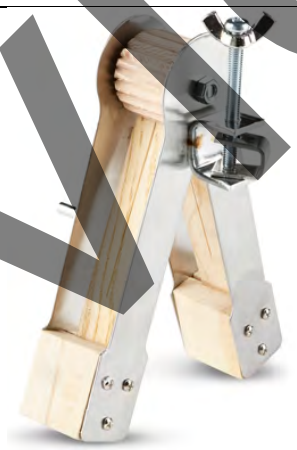
PERCUSSION

Large 8" Wood Frog Guiro Rasp	Small 2.5" Wood Frog Guiro Rasp	Ratchet, mod instructions on the webpage	Vibra-Slap Standard

10-inch Percussion Rhythm Rasp Stick

Paint str stick, suitable for the bow-stick

Bow-stick construction

To make the bowstick a small wooden board should be used averaging:
330 mm (12-inch, 22 cm) in length
27.94 mm (1.1-inch, 2.794 cm) in width

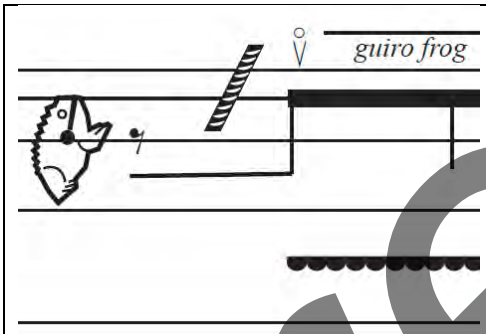
5 mm (0.19685-inch, 0.5 cm) in depth
More information and video instructions available on the APE webpage.

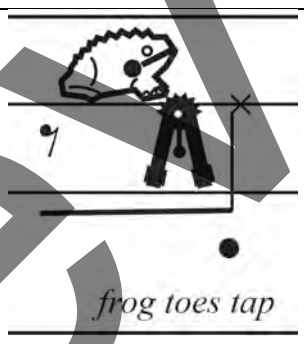
Ratchet Modification

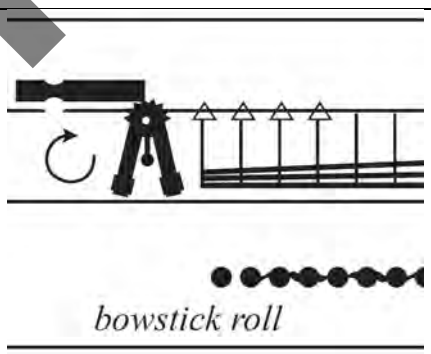
The Trophy Ratchet Effect (pics below) is recommended for the modification but most of ratchets will do with the appropriate modification.

<https://www.musiciansfriend.com/drums-percussion/trophy-ratchet-effect>

Please follow the step-by-step video instructions to modify the ratchet
contact the composer to receive a private link to access the video.







STAFF
- FROG and RATCHET STAFF: the ratchet staff is divided in 4 main sections the paddle at the bottom, the handle in the middle, the gear wheel at the top. The length of the stretched note-head indicates duration and the thickness the amount of pressure of the bow-stick on the wheel or elsewhere, the thicker the more pressure the thinner the less pressure. Each sound is described with a keyword and a descriptive symbol, in addition text notes in a box may provide further information. The bow-stick indicates its vatical position with a solid black rectangle for the flat side and its flat position with a thick line.
- SOUND STAFF: The lower section of the staff provides a visualization of the sound to be produced. The vertical axis represents frequency and the horizontal axis time. Generally, the coloring/density represents loudness, black for the loud to white for quite sounds. The patterns displayed in this section provide an arbitrary visualization of the sound to be produced such as high/low, bright/dull, ordered/chaotic, coherent/erratic, smooth/coarse, soft/raspy, tonal/noisy, etc. In addition, a number of onomatopoetic and/or echomimetic words and expressions aiming to represent or imitate a sound or its context such as aggressive, peaceful, mournful cry of pain, mental and physical suffering, sorrow or pleasure.

PIANO

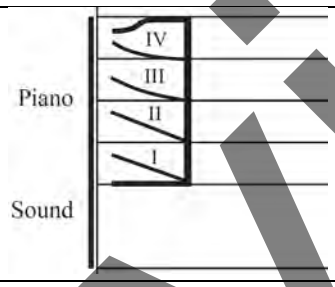
PIANO ACCESSORIES

Wooden Stirrer ~7 ½" (these sticks are easily found in coffee shops)

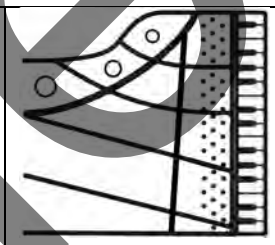
10-inch Percussion Rhythm Rasp Stick

Snare Drumstick
 
Triangle Beater | one cent coin

(a)



(b)



(c)

PIANO STAFF

The piano clefs with two lines staff, figures bottom, indicate inside piano. The two lines (a) define the two extremes of the piano, front to back or left (lower line) to write. The space from bottom to top line provides a proportional space from front beginning of the string to back end of the string; or left lowest key/string to right highest key/string.

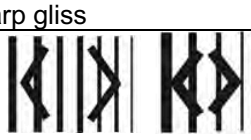
An extra indication about the specific string, register or frame is indicated with roman number as Frame I, Frame II, III and IV, see image (b).

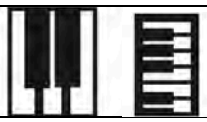
The vertical piano (b) clef indicates movements longitudinal to the string(s) like slide guitar.

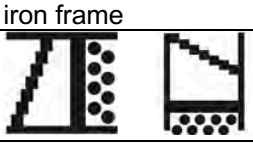
The horizontal piano clef (c) indicates movements vertical to the strings, like harp glissando. The two lines define the lowest string at the bottom and the highest string at the top.

NOTES: The depth of the movement toward the back of the board should not exceed the length of the performers arm from the front of the piano.

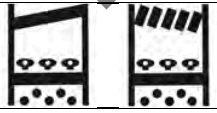
In case the piano's frame constrains the gestures inside on some strings you can chose the closest most convenient position instead.

On the strings, (front-back) longitudinal	On the strings (left-right) harp gliss	On the keyboard	between bridge and cast-iron frame
			






Area between agraffes and cast-iron frame II, I	Lowest Frame I, from dampers to bridge	Highest Frame IV, from dampers to bridge	Mid Frames II, III from dampers to bridge
			



Sound Lexicon

Besides the in-score descriptions of the performance notes a complete catalogue of detailed audio/video examples is provided upon request by the composer. This is in order to give to the performer a better insight on how to produce each particular sound, which is so crucial for the piece.

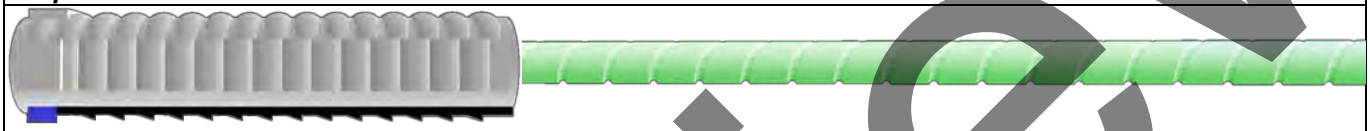
For detailed performance notes, please refer to the online video demonstrations.

***

Strings

INSTRUMENT PREPARATION

***Rasp Bow** - fabricated*



The frog part (gray) consists of 5 surfaces; the bottom (black) saw surface is used to produce click, roll, pluck, glissando sounds, etc. The blue section is used to produce snap and click sounds. The rasp (green part) is also played vertical and horizontal to the strings to produce roll, rattle, rasp, and glissando sounds among others.
NOTE: The bow should have rosin applied from side to side using a standard bow for application,

Detune
The two outer strings I and IV should be detuned nearly two octaves lower. Please refer to the audio examples provided on the dedicated webpage.

String tension varies from set to set and from instrument to instrument. The light or thin gauge strings may feel more lose as the strings require less tension to bring them to the pitch they have been engineered for, and respectively heavy/ think gauge strings need more tension to stretch them up to the pitch they have been engineered for.

STAFF
- The **lower** section below the three staff lines corresponds to the neck including the Pegbox. Also, it may provide text descriptions and/or visualizations of the sound to be produced. The vertical axis represents frequency and the horizontal axis time. Generally, the coloring represents loudness in terms of the frequency from black for the loud frequencies to white for silence. The patterns displayed in this section provide an arbitrary visualization of the sound to be produced such as high/low, bright/dull, ordered/chaotic, coherent/erratic, smooth/coarse, soft/raspy, tonal/noisy, etc. In addition, several onomatopoetic and/or echo-mimetic words/letters aiming to represent or imitate a sound or its context such as aggressive, peaceful, mournful cry of pain, mental and physical suffering, sorrow or pleasure.
- The **second** section from the bottom corresponds to the instrument's second half middle of fingerboard to nearly end.
- The **third** (top) section indicates the position of the bow from ST (end of fingerboard) to the bridge. The string number is shown in roman numbers I, II, III and IV.
- The **fourth** section above the three lines corresponds to the area between the bridge and the fine tuners.

- SOUND STAFF: The lower section of the staff provides a visualization of the sound to be produced. The vertical axis represents frequency and the horizontal axis time. Generally, the coloring/density represents loudness, black for the loud to white for quite sounds. The patterns displayed in this section provide an arbitrary visualization of the sound to be produced such as high/low, bright/dull, ordered/chaotic, coherent/erratic, smooth/coarse, soft/raspy, tonal/noisy, etc. In addition, a number of onomatopoetic and/or echomimetic words and expressions aiming to represent or imitate a sound or its context such as aggressive, peaceful, mournful cry of pain, mental and physical suffering, sorrow or pleasure.

Sound Lexicon

Besides the in-score descriptions of the performance notes a complete catalogue of detailed audio/video examples is provided upon request by the composer. This is in order to give to the performer a better insight on how to produce each particular sound, which is so crucial for the piece.

For detailed performance notes, please refer to the online video demonstrations.

***

Electronics

FIXED ELECTRONICS
The Spectrogram below displays the frequency on the vertical axis and the time on the horizontal axis. Moreover, the colorings of grey indicate frequency loudness (from black for loud frequencies to white for silence). It works as visual representation of the tape part in order to guide/ help the performer to follow it easier and more accurately. The spectrogram aims to make it easier to discern individual musically meaningful features. At the left top corner of every staff there is a timestamp of the prerecorded material.

CLICK TRACK
Download the tape part and the click track so that you can create your DAW project.
The stereo electronic part and the amplified sax should be projected from the speakers system.
The click track file should be assigned to a separate output send to the performer's earbuds on stage.

AMPLIFICATION
For the right projection of the sound details the use of amplification should be applied. It is recommended that both instruments are amplified using a piezo transducer (contact microphone) and condenser microphones.
Mixer/ Audio Interface with 2 to 8 inputs
2 or more loudspeakers with subwoofer
Compressor/ Limiter (optional)
To intensify the soft sounds and keep untouched the loud sounds without clipping some compression should be applied. This is something that most of the digital mixers have. Also, it is possible by a variety of software plug-ins.
NOTE: It is part of the aesthetic of the piece to create a superficial amplification, which results to the loss of the neutrality of the classical known instrumental sound. It is a microscopic point of view.

REVERBERATION (optional)
Refer to audio reverb reference file (ViperSnake_reverb-reference.wav)
A simple Hall Grand Chamber Type reverb (preferable algorithmic). The numbers below are indicative and depended on the actual performance space and reverberation unit.
Mix: 15% wet, 85% dry
Pre-delay: 0
Decay: 1.5”
Reverb time: ~1”
High Cut: 5500 Hz

Triassic of Madagascar ♩= 80
